

Pune Paneer Quality Control - Business Solution

Recruiter-facing Business Analyst solution brief | Portfolio case study

1. Business problem

Food-service businesses need reliable paneer while managing supplier cost, traceability, compliance and customer trust. Public enforcement evidence in Pune shows that quality issues can involve upstream manufacturing, storage, documentation and distribution. The proposed solution is a practical control framework, not a claim about every supplier or restaurant.

2. Stakeholders

Stakeholder	Need
Procurement	Approved suppliers, cost and continuity
Food Safety / QA	Compliance, testing and corrective action
Operations	Receiving and storage controls that work at outlet level
Finance	Cost impact of rejection, testing and supplier change
Management	KPI visibility and exception alerts
Customer-facing teams	Accurate product disclosure and complaint handling

3. Proposed process

Supplier qualification -> licence/document verification -> approved supplier list -> purchase order -> receipt -> batch log -> receiving inspection -> risk-based testing -> supplier scorecard -> dashboard -> corrective action.

4. Business rules

- No approved supplier record = no standard purchase approval.
- Missing invoice/batch information = exception to be resolved before the stock is released into normal inventory.
- Repeated exceptions or failed tests = higher testing frequency and supplier review.
- A laboratory outcome should be stored against the sample/batch so the event can be traced back to the supplier.
- Public regulatory status and internal supplier status should be kept as separate fields.

5. Dashboard requirements

Dashboard area	Required view
Executive KPIs	Supplier documentation compliance %, test pass rate, open exceptions, average closure time
Supplier performance	Supplier-wise scorecard and exception trend
Batch traceability	Supplier -> batch -> receipt -> test result
Risk / exceptions	Open issues requiring management action
Trend	Monthly quality and exception trend
Audit trail	Link from KPI to source record / evidence

6. Future-state model

Current state	Future state
Reactive investigation after complaint	Preventive supplier and batch controls
Supplier information fragmented	Standard supplier master + verification
Paper/invoice records disconnected	Batch-linked digital traceability
Testing treated as isolated event	Testing linked to supplier/batch and scorecard
Management gets reports later	Exception-based dashboard

7. Implementation roadmap

Phase	Deliverable	Owner
0-30 days	Supplier master, FSSAI verification checklist, invoice/batch fields	Procurement + QA
31-60 days	Receiving checklist, testing schedule, supplier scorecard	QA + Operations
61-90 days	Dashboard, exception workflow, audit trail	BA/BI + Operations

8. BA contribution demonstrated

- Problem definition and scope control
- Stakeholder identification and requirements
- Data sourcing and data-quality limitations
- SQL-based analysis and KPI design
- Dashboard requirements and management communication
- Root-cause / control-gap analysis
- Future-state process and implementation roadmap

9. Accuracy note

This is a portfolio case study. Public enforcement facts are sourced; no private restaurant supplier data is claimed. The project intentionally does not invent restaurant-tier adulteration probabilities.
